THE HARDY FERN FOUNDATION

P.O. Box 3797

Federal Way, WA 98063-3797

Web site: www.hardyferns.org

The Hardy Fern Foundation was founded in 1989 to establish a comprehensive collection of the world's hardy ferns for display, testing, evaluation, public education and introduction to the gardening and horticultural community. Many rare and unusual species, hybrids and varieties are being propagated from spores and tested in selected environments for their different degrees of hardiness and ornamental garden value.

The primary fern display and test garden is located at, and in conjunction with, The Rhododendron Species Botanical Garden at the Weyerhaeuser Corporate Headquarters, in Federal Way, Washington.

Satellite fern gardens are at the Birmingham Botanical Gardens, Birmingham, Alabama, California State University at Sacramento, Sacramento, California, Coastal Maine Botanical Garden, Boothbay, Maine, Dallas Arboretum, Dallas, Texas, Denver Botanic Gardens, Denver, Colorado, Georgeson Botanical Garden, University of Alaska, Fairbanks, Alaska, Harry P. Leu Garden, Orlando, Florida, Inniswood Metro Gardens, Columbus, Ohio, New York Botanical Garden, Bronx, New York, and Strybing Arboretum, San Francisco, California.

The fern display gardens are at Bainbridge Island Library, Bainbridge Island, WA, Bellevue Botanical Garden, Bellevue, WA, Lakewold, Tacoma, Washington, Les Jardins de Metis, Quebec, Canada, Rotary Gardens, Janesville, WI, University of Northern Colorado, Greeley, Colorado, and Whitehall Historic Home and Garden, Louisville, KY.

Hardy Fern Foundation members participate in a spore exchange, receive a quarterly newsletter and have first access to ferns as they are ready for distribution.

President's Message

Welcome to the first issue of the Quarterly celebrating the twentieth anniversary of the Hardy Fern Foundation. Each issue this year will have a special focus commemorating the accomplishments of the organization and featuring particular aspects of ferns and fern culture. This winter issue is dedicated to the first index of the articles from all of the Quarterlies. This is a project that we have been in need of for quite some time and we would like to thank Jerry Hudgens for all of his many hours of work on this monumental task. Also look on our website for an upcoming full reference index, painstakingly compiled by Jerry, of the ferns from all the articles.

Those members interested in traveling should look into the fall HFF and BPS (BritishPteridological Society) sponsored trip to Central and Southern California. The tour will start in San Francisco run north to the redwoods then south to the Los Angeles area and finally back to the Bay Area. This two week excursion will feature some of the best fern gardens and some of the most spectacular scenery in the country. Thanks to Sue Olsen, Dan Yansura and Darren Lloyd for acting as our tour guides and setting up this excellent tour.

If you are in Seattle February 18th to 22nd or you live near by come see the HFF booth at the Northwest Flower & Garden Show. It is one of the largest shows in the US and has a fantastic lecture series. If you are interested in volunteering for the HFF booth there are shifts still available. Michelle Bundy at HFF@hardyferns.org can let you know the details. Don't wait too long these shifts will often fill quickly.

Late December brought one of the heaviest snows in years to the Seattle area. Unfortunately, our nursery hoop with the HFF ferns inside collapsed under the weight. On the bright side we have been considering replacing this structure for the last year. Former president and current board member John van den Meerendonk procured a grant to help replace this structure and donated a new hoop and founding member and Honorary Board Member Sylvia Duryee contributed funds to complete this project. Thank you to you both, we are all looking forward to seeing this new nursery hoop being built and all of the new plants that will soon be coming out of it.

The new Victorian stumpery is currently being installed at the Rhododendron Species Botanical Garden. Nine truck loads of enormous stumps and logs are being arranged under a canopy of Douglas fir for a fantastic display of extraordinary ferns. Keep a look out for future work parties to finish the installation of the spectacular project. I hope the remainder of winter treads lightly on your gardens and all the best for an early spring!

Richie Steffen

Dryopteris formosana

Formosan wood fern

James Horrocks
Salt Lake City, Utah

This is a most interesting medium sized fern native to the forested areas of Taiwan (Formosa) and Japan. It superficially resembles some species of *Arachniodes* because of its rather unique frond outline. The beautiful evergreen fronds are one to two feet long, rarely longer, although three feet has been reported.

Description: The rhizome is short-creeping to erect and ascending, retaining the basal stubs of old stipes. The stipes are grooved and covered in dark brown spreading scales, the lower scales being lanceolate and somewhat lustrous, while the upper scales are broadly linear and often deflexed or bent downward. The scales are numerous along the rachis and the scales on the underside of the costa are somewhat inflated rather than flat. The stipes are about half the length of the fronds.

The 18 to 24 inch fronds are mostly bipinnate, becoming tripinnate below and exhibiting a five-sided or pentagonal outline. The fronds are unique in that the lowest pair of basispic pinnules next to the rachis are quite elongated. The second and third pairs next to them may also be elongated but to a lesser degree, usually $\frac{3}{4}$ to $\frac{1}{2}$ the length of the first pair. They point downward while the rest of the frond is often held in a horizontal plane which is unusual for a *Dryopteris*.

The pinnae pairs are usually less than 12 in number and the pinnules are narrowly ovate-oblong or lanceolate. This species is considered evergreen except in very cold areas where it is said to be "tardily deciduous". The sori are in two series, medial, with orbicular- reniform (kidney-shaped) indusia. This species is apogamous.

Culture: The Formosan wood fern is considered hardy to Zone 6. It is said to be drought tolerant and easily cultivated although it did not do well in the author's garden here in Salt Lake City. Perhaps another try is warranted. (If a new plant seems a bit small, often times it can be potted up and placed in a cold-frame for a season or two until it is larger. Then it can be set out in the garden in late fall or early spring with a much greater chance of surviving.) The golden green fronds of *Dryopteris formosana* appear rather late in the spring but are very attractive although they are not as numerous as in other species. Being apogamous, this species is easily grown from spore.

Hardy Fern Foundation Spore Exchange 2008 -'09

To Order: Please print your selections in alphabetical order. Include 50 cents for each fern requested, postage (Check made payable to Hardy Fern Foundation) and a self addressed bubble envelope (please do not attach the postage to the envelope). If you are ordering more than a half dozen packages, please send additional postage up to one dollar's worth. There are no additional charges applied to overseas members, but please enclose an international postage coupon (2 for large orders) and an envelope. Please list a first and second choice. Some items are limited, so order early for best selection. If both choices are unavailable, would you like to donate the additional money to the foundation, or hold it for another order? If neither is indicated, we will consider it a donation to our endowment fund. At this time orders are not taken from the internet, so please follow instructions above. Orders will be sent within a month of post mark date.

Your fresh spores are always appreciated!!! We are trying to restock our inventory this year, so please consider collecting spore and donating it to the exchange. (Please package with collector's last name and year collected on package - individually packaged spore is much appreciated). **Mail requests to:**

THE PTERIDOLOGIST WHO NEVER WAS

Alan Ogden

Worcestershire, U.K.

I was relaxing by reading the Summer 2008 edition of the “Hardy Fern Foundation Quarterly” when I was surprised to come across a mention of “Robert’s Oak Fern” (on p.58, end of first paragraph). This awakened a memory of the first time I came across this name for *Gymnocarpium robertianum* when I was visiting Nelson Maher in Owen Sound on the Bruce Peninsula, Ontario. Nels was autographing for me a new book “A Guide to the Ferns of Grey and Bruce Counties, Ontario” which had been produced by his local group the Bruce-Grey Plant Committee.

I had noticed that the section on *Gymnocarpium robertianum* was headed “Robert’s Fern” so I told Nels I thought this was incorrect. I believed the name alluded to the similarity of the scent of the crushed frond to the bruised leaves of *Geranium robertianum* and not to any botanist of that name.

His response was a little strange, he gave me a sort of odd smile and the discussion passed on to other things. Now, in 2008, coming across that name again I began to wonder if I was right – where had I learned that rather arcane bit of information?

I was sure it must have been in Reg Kaye’s book “Hardy Ferns” which had been my inspiration in my first years of ferning - but it wasn’t there. He did mention that this fern had been known as *Polypodium calcareum* (limestone polypody) for many years which helped me to find it in older books.

Maybe it could have been in another of my textbooks, Chris Page’s book “The Ferns of Britain and Ireland”? He says about it, “. . . and when a portion of frond is bruised lightly between finger and thumb, it gives off a distinctive, rather sweet, apple-like smell, not found in Woodland Oak-Fern.” No mention of geraniums though, I was beginning to panic a little – where had I read it?

I went back to an earlier book meant for popular use, “Wayside and Woodland Ferns” by Edward Step and there I found it. Under the title “Limestone Polypody – *Dryopteris Robertiana* = *Polypodium Robertianum*” he explains, “The name Robertiana is borrowed from Herb Robert (*Geranium robertianum*), on account of a resemblance between the unpleasant odour of each.”

There was more to come. “British Ferns and Mosses” by Peter Taylor in the Kew Series informs us, “The specific epithet, robertianum, alludes to the smell of the crushed fronds which is said to resemble that emitted by a species of Cranesbill, *Geranium robertianum*.”

Flushed with success I travelled back in time to Newman’s little book, “British Ferns. Fourth Edition.” and hit the jackpot. He has it listed as “Smith’s Fern” and in the

description says”. .and a very strong and peculiar smell, which has been compared to that of the Herb Robert Geranium, a peculiarity from which the name is derived.”

So there it is, there never was a fern man called Robert but there was a Sir J.E.Smith who was the first president of the Linnaean Society and it was he who first described the fern in the British Isles.

Then I got to thinking about Nels Maher and that strange smile he gave me. He was a careful man who certainly knew his ferns so where did he get misled? John Mickel in his “Ferns for American Gardens” also lists “Robert’s oak fern” and “A Field Guide to the Ferns” by Boughton Cobb does too but Hoshizaki and Moran’s “Fern Grower’s Manual” doesn’t. Robert’s fern only seems to exist in North American literature but how long has it been there? It needs someone with a bigger library than me to discover who started it.

Postscript. It might be appropriate to ask how the geranium got its name. Sometimes known as “Stinking Cranesbill” from the resemblance of the seed pods to a crane’s beak it was popular among medieval herbalists who found a use for anything with a strong smell or taste. It was often grown in monastery gardens which were the main source of “physick”. It is suggested (by an Internet search) that the name “Herb Robert” was from Abbot Robert later Saint Robert the founder of the Cistercians in 1098 when he was Abbot of Molesme in Citeaux, Cote d’Or.

Hardy Fern Foundation

Index of Articles

Fall 1990 - Fall 2008

After 19 years of publishing information about hardy ferns, first as the Hardy Fern Foundation (HFF) Newsletter and continuing to the present as the HFF Quarterly, the HFF has nearly 600 articles to its credit. With the goal in mind of making the information more readily available to current and future pteridophiles, Sue Olsen, the editor of the publications since inception, asked me, a fern hobbyist and enthusiast, if I would be willing to put together a comprehensive index. I agreed to attempt to do so, a task that has spanned the last 12 months (mostly on either side of my gardening season), allowing for the inclusion of the 2008 publications.

To accomplish the task in an efficient manner, I created two indexes. I decided first to create an Index of Articles, numbering them sequentially over the 18 volumes of the Newsletter and the Quarterly. This comprehensive index will be found on page 10 of this issue. Subsequently, I created an Index of Ferns, with the entries for each fern mentioned being the article numbers. Thus, those interested can look up a fern in the Index of Ferns and determine which articles in the Index of Articles have information about, or at least mention, that fern. This fern index along with its cross-reference the Index of Articles will be posted on the HFF website www.hardyferns.org and will be updated annually. Members will therefore have access to and a reference for previously published information.

Due to taxonomic changes over the 18 years covered and to the varying native languages and backgrounds of the authors, several inconsistencies were encountered. These are reflected in cross-referencing alternate terms and listing alternate spellings when the latter could be determined not to be simple misidentifications or misspellings.

Consistent with the mission of the HFF, its Board is exploring ways of making the previously published materials covered by the indexes available to fern enthusiasts and others in the horticultural community. Once the mechanism is in place ordering information will be posted along with the indexes on the web site.

Corrections to these indexes and suggestions from readers regarding future versions will be appreciated and should be directed both to me and the Editor of the Quarterly.

Summer Fern Course in Maine

The Humboldt Field Research Institute, located near Steuben, Maine, will offer a fern course, *Taxonomy and Biology of Ferns and Lycophytes*, from 17-21 August 2009. The course will be taught by Robbin Moran, Curator of Ferns at the New York Botanical Garden. It will emphasize the identification, phylogeny, and ecology of local ferns and lycophytes. Lectures will be in the morning and field trips in the afternoon. For more information, visit the following web site: <http://www.eaglehill.us> You can also contact the Station Director, Joerg-Henner Lotze, Humboldt Field Research Institute, PO Box 9, 59 Eagle Hill Road, Steuben, ME 04680-0009 USA Phone: 207-546-2821, FAX: 207-546-3042; office@eaglehill.us
